                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Dр
      An isolated nucleic acid molecule encoding an interleukin-1-like polypeptide ("IL-11p) that retains one or more activities of the peptide from which it is derived, such as the IL-18R binding activity of a human interleukin-1 receptor antagonist-1 (hIL-1Ral) polypeptide, is new. The nucleic acids may be used in molecular engineering applications, e.g. hybridization assays and chromosome and gene mapping studies, for recombinantly producing the IL-11p polypeptide or for producing gene knock out animals to study the role of the protocols may be used to supplement a patients production of the polypeptide or to rectify mutations that lead to the production of in active peptides). The complete produced may be used to screen for and produce modulators (e.g. antibodies) of IL-11p protein expression and activity which may be use to treat disorders associated with inappropriate IL-11p expression and activity, such as inflammatory disorders, asthma, arthritis, sepsis, acute lung injury, adult respiratory distress syndrome, idiopathic pulmonary fibrosis, ischemic reperfusion disease, psociasis, graft versus host disease and/or inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 osteopathic; intanti-asthmatic; anti-ischemic; degene therapy; ds

IL-1
                                                                                                                                                                                                                                                                                                                                                                                           This sequence encodes an interleukin-1 (IL-1)-related polypeptide. IL-1 related polypeptide was isolated from HPB-MLT cells, FERM-BP-2430, an established human T-cell line. IL-1 related polypeptide is useful for inhibiting natural killer (NK) activity, which is related to the immune system of mammals. The DNA encoding the IL-1 related polypeptide is useful in gene therapy of patients in need of NK activity inhibition and others suffering from immunodeficiency.
                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ushio

This cDNA was cloned from a human foetal lung cDNA library. The zilla4 proteins modulate inflammation and other immunological processes and are therefore useful for treatment of arthritis, psoriasis, septic shock, graft-versus-host disease and leukaemia. Other diseases that may be modulated by zilla4 proteins include cancer, anaemia, inflammatory bowel disease, acute and chronic neuropathologies, shock, respiratory disease syndrome, restenosis and acquired immune deficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human interleukin-1; IL-1; zilla4 protein; inflammation; arthritis; psoriasis; septic shock; graft-versus-host disease; leukaemia; cancer; anaemia; inflammatory bowel disease; acute neuropathology; shock; chronic neuropathology; respiratory disease syndrome; restenosis; acquired immune deficiency syndrome; AIDS; antiinflammatory; cytostatic; anti-arthritic; anti-psoriatic; antibacterial; immunosuppressive; anti-anaemic; neuroprotective; vasotropic; anti-human immunodeficiency virus; HIV; ss.

```

```
An isolated nucleic acid molecule encoding an interleukin-1-like C polypeptide (IL-llp) that retains one or more activities of the peptide (I from which it is derived, such as the IL-18R binding activity of a human interleukin-1 receptor antagonist-1 (hIL-1Ra1) polypeptide, is new. The nucleic acids may be used in molecular engineering applications, e.g. C hybridization assays and chromosome and gene mapping studies, for recombinantly producing the IL-llp polypeptide or for producing gene knock out animals to study the role of the protein in metabolism and cisease processes (conversely, gene therapy protocols may be used to supplement a patients production of the polypeptide or to rectify mutations that lead to the production of in active peptides). The peptides produced may be used to screen for and produce modulators (e.g. antibodies) of IL-llp protein expression and activity which may be use to treat disorders associated with inappropriate IL-llp expression and activity, such as inflammatory disorders, asthma, arthritis, sepsia, acute lung injury, adult respiratory distress syndrome, idiopathic pulmonary fibrosis, ischemic reperfusion disease, psoriasis, graft versus host disease and/or inflammatory bowel disease.

                                                                                                                                                                                                                      homolog zilla4 protein designated zilla4-E200K. The replacement of Glu (200) with Lys results in change in activity from agonist to antagonist. The zilla4 proteins modulate inflammation and other immunological processes and are therefore useful for treatment of arthritis, psoriasis, septic shock, graft-versus-host disease and leukaemia. Other diseases that may be modulated by zilla4 proteins include cancer, anaemia, inflammatory bowel disease, acute and chroneuropathologies, shock, respiratory disease syndrome, restenosis acquired immune deficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                     treatment disease, ]

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               pancreatitis), neurological (e.g. epilepsy, ischemic cerebrovascular disease, stroke), reproductive (infertility, ovulatory defects, endometriosis), autoimmune /inflammatory (actinic keratosis, acquired immunodeficiency syndrome (AIDS), Addison's disease), and cell proliferative disorders including cancers (of the breast, adrenal gland, contritional and metabolic diseases of the neurous system, myopathies, mental disorders (anxiety, schizophrenia, mood), as well as infections caused by parasites (malaria, leishmania, trypanosoma), viral (adenovirus, coronavirus, flavivirus), bacterial (e.g. pneumococcus, staphylococcus, bacillus), and fungal (aspergillus, blastomyces, dermatophytes) agents. The nucleic acids, polypeptides, antagonists, agonists, pharmaceutical compositions, and antibodies may also be used for treating or preventing disorders associated with increased or decreased expression or activity of EXCS. EXCS polynuclectides may also be used to detect and quantify gene expression in biopsied tissues in which expression of EXCS may be correlated with the disease, to determine presence or excess expression of EXCS, to monitor regulation of EXCS levels during therapeutic intervention, to detect the presence of associated disorders, as targets in microarray, to generate hybridization or activity of excess expenses of antagonists or inhibitors. Sequences any also be used individuals. Antibodies may also be used in diagnosing or inhibitors. Sequences AAC84293-C84318 represent nucleic antiqued modeling the EXCS of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match 88.0%;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of human interleukin-1 zeta (IL-1 zeta), a member of the IL-1 family. The sequence was determined by translation of the nucleotide sequence of isolated IL-1 zeta CDNA (see AAA27918). IL-1 zeta mRNA is generated from exons 3-6 of the IL-1 zeta locus. The mRNA is expressed most strongly in the testis, prostate, colon, brain, placenta, lung, foetal liver and lymph nodel stroma, lung, testis and placenta. The invention is directed to novel, purified and isolated IL-1 zeta, IL-1 zeta splice variants and Xrec2 polypeptides (see AAY95297-301), the nucleic acids (see AAA27918-22) encoding such polypeptides, and their uses. The polypeptides can be used to study cellular processes such as immune regulation, cell proliferation, cell death, cell migration, cell-to-cell interaction and inflammatory responses, to identify proteins associated with IL-1 zeta, to screen for potential inhibitors, and to prepare antibodies. In particular, they can be used to activate and/or inhibit the induction of local tissue destruction and fever, inhibit and/or stimulate macrophages and vascular endothelial cells to prostaglandins, nitric oxide synthetase, and metalloproteases, and upregulate and/or inhibit the upregulation of molecules on the surface of vascular endothelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                               밁
                                                                                                                                                                                                        Qy
                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                            γQ
                                                                                 RESULT 3
                                                                                                                                                                                                                                                                                                                                                                  An isolated nucleic acid molecule encoding an interleukin-1-like C polypeptide (IL-11p) that retains one or more activities of the peptide from which it is derived, such as the IL-18R binding activity of a human interleukin-1 receptor antagonist-1 (hIL-1Ra1) polypeptide, is new. The nucleic acids may be used in molecular engineering applications, e.g. hybridization assays and chromosome and gene mapping studies, for recombinantly producing the IL-11p polypeptide or for producing gene knock out animals to study the role of the protecin in metabolism and disease processes (conversely, gene therapy protocols may be used to supplement a patients production of the polypeptide or to rectify mutations that lead to the production of in active peptides). The peptides produced may be used to screen for and produce modulators (e.g. antibodies) of IL-11p protein expression and activity which may be use to treat disorders associated with inappropriate IL-11p expression and activity, such as inflammatory disorders, asthma, arthritis, sepsis, acute lung injury, adult respiratory distress syndrome, idiopathic pulmonary fibrosis, ischemic reperfusion disease, psoriasis, graft versus host disease and/or inflammatory bowel disease.
                                                                                                                                                                                                                                                                                      Query Match

                                                                                                             뮹
                                                                                                                                                                                                                                          The present sequence is that of splice variant TDZ.2 (testis-derived zeta variant) of human interleukin-1 zeta (IL-1 zeta). TDZ.2 mRNA is generated from exons 1, 4, 5 and 6 of the IL-1 zeta locus, and the encoded protein is probably a functional IL-1 like molecule. TDZ.2 mRNA is expressed most strongly in the testis and bone marrow. The invention is directed to novel, purified and isolated IL-1 zeta, its splice variants and Xrec2 polypeptides (see AAY95297-301), the nucleic acids (see AAA27918-22) encoding such polypeptides, processes for production of recombinant forms of such polypeptides, and their uses. The polypeptides can be used to study cellular processes such as immune regulation, cell proliferation, cell death, cell migration, cell-to-cell interaction and inflammatory responses, to identify proteins associated with IL-1 zeta, to screen for potential inhibitors, and to prepare antibodies. In particular, they can be used to activate and/or inhibit the activate and/or inhibit the activate and/or inhibit the induce and/or inhibit the induction of local tissue destruction and fever, inhibit and/or stimulate macrophages and vascular endothelial cells to prostaglandins, nitric oxide synthetase, and metalloproteases, and currequilate and/or inhibit the upregulation of molecules on the surface of vascular endothelial cells.
                                                                                                                                                                Query Matcl

The IL-1H4 polypeptide can be expressed by standard recombinant methodology. The IL-1H4 polypeptide, polynucleotides and modulators are useful for treating chronic and acute inflammation, septicemia, autoimmune diseases (e.g., inflammatory bowel disease, psoriasis and arthritis), transplant rejection, graft versus host disease, infection, stroke, ischemia, acute respiratory disease syndrome, allergies, asthma, restenosis, brain injury, AIDS, bone diseases (e.g., osteoporosis), cancer (e.g., lymphoproliferative disorders), congestive heart failure, atherosclerosis and Alzheimer's disease. The IL-1H4 polynucleotides are useful as diagnostic reagents and for chromosome identification. The present sequence represents the IL-1H4 mature

                              밁
                                                                                                                                                                                                                         C An isolated nucleic acid molecule encoding an interleukin-1-like polypeptide (IL-11p) that retains one or more activities of the peptide (I from which it is derived, such as the IL-18R binding activity of a human interleukin-1 receptor antagonist-1 (hIL-1Ra1) polypeptide, is new. The nucleic acids may be used in molecular engineering applications, e.g. hybridization assays and chromosome and gene mapping studies, for recombinantly producing the IL-11p polypeptide or for producing gene knock out animals to study the role of the protocols may be used to supplement a patients production of the polypeptide or to rectify mutations that lead to the production of in active peptides). The peptides produced may be used to screen for and produce modulators (e.g. antibodies) of IL-11p protein expression and activity which may be used to treat disorders associated with inappropriate IL-11p expression and activity, such as inflammatory disorders, asthma, arthritis, costeoarthritis, sepsis, acute lung injury, adult respiratory distress syndrome, idiopathic pulmonary fibrosis, ischemic reperfusion disease, psocriasis, grafit versus host disease and/or inflammatory bowel disease.
                                                                                                                                           Query Match

The nucleic acids may be used in molecular engineering applications, e.g. hybridization assays and chromosome and gene mapping studies, for recombinantly producing the II-11p polypeptide or for producing gene knock out animals to study the role of the protein in metabolism and disease processes (conversely, gene therapy protocols may be used to supplement a patients production of the polypeptide or to rectify mutations that lead to the production of in active peptides). The peptides produced may be used to screen for and produce modulators (e.g. antibodies) of II-11p protein expression and activity which may be used to treat disorders associated with inappropriate II-11p expression and activity, such as inflammatory disorders, asthma, arthritis, costeoarthritis, sepsis, acute lung injury, adult respiratory distress syndrome, idiopathic pulmonary fibrosis, ischemic reperfusion disease, psoriasis, graft versus host disease and/or inflammatory bowel disease.
                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                        The present sequence is the human interleukin (IL)-1 homolog zilla4 protein. This protein contains a core structure of 12 beta-strands wound into a beta-barrel, with the beta-stands seperated from each other by loops. The loops between these beta-strands are highly variable among the family members and are believed to be involved in receptor binding. The zilla4 proteins modulate inflammation and other immunological processes and are therefore useful for treatment of arthritis, psoriasis, septic shock, graft-versus-host disease and leukaemia. Other diseases that may be modulated by zilla4 proteins include cancer, anaemia, inflammatory bowel disease, acute and chronic neuropathologies, shock, respiratory disease syndrome, restenosis and acquired immune deficiency syndrome.

                                                                                                                            日
                                                                                                                                                                                                                                                                      The present sequence is that of splice variant TDZ.1 (testis-derived zeta variant) of human interleukin-1 zeta (IL-1 zeta). TDZ.1 mRNA is generated from exons 1, 2, 4, 5 and 6 of the IL-1 zeta locus, and the encoded protein is probably a functional IL-1 like molecule. TDZ.1 mRNA is expressed most strongly in the kidney, skeletal muscle, testis, prostate, ovary, colon, small intestine, liver, placenta, lung, tonsil, foetal liver, lymph node and bone marrow. The invention is directed to novel, purified and isolated IL-1 zeta, its splice variants and xrec2 polypeptides (see AAY95297-301), the nucleic acids (see AAA27918-22) encoding such polypeptides, processes for production of recombinant forms of such polypeptides, and their uses. The polypeptides can be used to study cellular processes such as immune regulation, cell proliferation, cell death, cell migration, cell-to-cell interaction and inflammatory responses, to identify proteins associated with IL-1 zeta, to screen for potential inhibitors, and to prepare antibodies. In particular, they can be used to activate and/or inhibit the induce and/or inhibit the induction of local tissue destruction and fever, inhibit and/or stimulate macrophages and vascular endothelial cells to prostaglandins, nitric oxide synthetase, and metalloproteases, and upregulate and/or inhibit the upregulation of molecules on the surface of vascular endothelial cells.
                                                                                                                                                                                Query Match

nt sequence is an alternative primate interleukin-1 like designated IL-1-zeta. The 12 beta strands, indicated in the table, fold into a beta-trefoil fold. The specification claims ed or recombinant polypeptide that: (a) specifically binds l antibodies generated against at least a 12 consecutive amino ent of IL-1-zeta (see AAY91884) or its allelic variant (see and (b) comprises at least one sequence selected from:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (first

IL-1-zeta is likel to play a role in systemic inflammatory reactions, such as fever, hypoglycemia, reduced plasma iron and zinc, the acute response of the liver, and increase plasma copper. IL-1-zeta binding compounds (comprising antigen binding sites) and IL-1-zeta polypeptides are also useful for both diagnostic and therapeutic purposes.
                    The present sequence represents a human interleukin 1 (IL-1) family protein having a combining affinity to a receptor of a protein of human IL-1 family higher than Tango-77. The protein is useful for the development of diagnostic, treating and/or preventive agents for various diseases.
                                                                                                                                                                                                                                                                                                                           Human; interleukin identification.

Peptide
                                                 The invention provides an isolated interleukin-1 homologue, IL-1H4 polypeptide. The IL-1H4 polypeptide can be expressed by standard recombinant methodology. The IL-1H4 polypeptide, polynucleotides and modulators are useful for treating chronic and acute inflammation, septicemia, autoimmune diseases (e.g., inflammatory bowel disease, psoriasis and arthritis), transplant rejection, graft versus host disease, infection, stroke, ischemia, acute respiratory disease syndrome, allergies, asthma, restenosis, brain injury, AIDS, bone diseases (e.g., osteoporosis), cancer (e.g., lymphoproliferative disorders), congestive heart failure, atherosclerosis and Alzheimer's disease. The IL-1H4 polypeptide.
                                                                                                                                                                                                                                                              Novel Interleukin-1 homolog, IL-1H4, for treating chronic and acute inflammation, septicemia, autoimmune diseases, transplant rejection, graft versus host disease, stroke, ischemia, allergy and asthma -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gene

                                                               This sequence represents an interleukin-1 (IL-1)-related polypeptide. IL-1 related polypeptide was isolated from HPB-MLT cells, FERM-BP-2430, an established human T-cell line. IL-1 related polypeptide is useful for inhibiting natural killer (NK) activity, which is related to the immune system of mammals. The DNA encoding the IL-1 related polypeptide is useful in gene therapy of patients in need of NK activity inhibition and others suffering from immunodeficiency.
                                                                                                                                                                                                                                                                                                                                                                                Homo

                                                                                                                                            The present sequence is a variant of human interleukin (IL)-1 c homolog zilla4 protein, consisting of Asp in place of Glu at position 200. The replacement of Glu (200) with Asp results in attenuation of pro-inflammatory activity of zilla4 protein. The zilla4 proteins modulate inflammation and other immunological processes and are therefore useful for treatment carthritis, psoriasis, septic shock, graft-versus-host disease are leukaemia. Other diseases that may be modulated by zilla4 protein include cancer, anaemia, inflammatory bowel disease, acute-and carquired immune deficiency syndrome.

Note: The present sequence is not shown in the specification but derived from human zilla4 protein sequence shown in figure-2 (AF)

                                                                                                                                                   The present sequence is a variant of human interleukin (IL)-1 homolog zilla4 protein designated zilla4-E200K. The replacement of Glu (200) with Lys results in change in activity from agonist to antagonist. The zilla4 proteins modulate inflammation and other immunological processes and are therefore useful for treatment of arthritis, psoriasis, septic shock, graft-versus-host disease and leukaemia. Other diseases that may be modulated by zilla4 proteins include cancer, anaemia, inflammatory bowel disease, acute and chroneuropathologies, shock, respiratory disease syndrome, restenosis acquired immune deficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                               West
